Efficiently Decentralized Software Management

Software, operating systems and configuration settings have to be modified or reinstalled regularly for individual users and computers. The reasons for this can be malfunctions but also changing requirements of an individual workstation. For the helpdesk, those responsible for software, and system administrators, these routine tasks pose an additional strain, in particular, if reaction times are strictly defined by internal service level agreements. At the same time, users expect their requests to be processed quickly, and rightly so, for without the right applications they cannot perform their job.

The decentralization of computer and software management is the key to reduced administration costs, quicker reaction to new requirements and a greater level of satisfaction for the end user. Departments must be able to distribute the required applications without delay and set up new systems. In order for this to work, a custom interface must be provided for software management that also allows employees with no IT background to safely access all important functions.

The Right Applications Within Easy Reach

When employed in connection with the unsurpassed level of automation achieved by the enteo v6 Solution Suite, enteo v6 Portal offers you a new dimension of efficient software management. In principle, the various departments can access the entire range of previously packaged applications via a web portal. Depending on their assigned authorizations, users are capable of independently distributing applications or completely setting up a computer including its operating system without placing an order with the IT department and having to wait. In this way, important applications are available more quickly and productivity is ensured.

Simple Use Through Wizards

enteo v6 Portal is available to all authorized users at all times without installing any additional software. The entire range of

Key Benefits of enteo v6 Portal

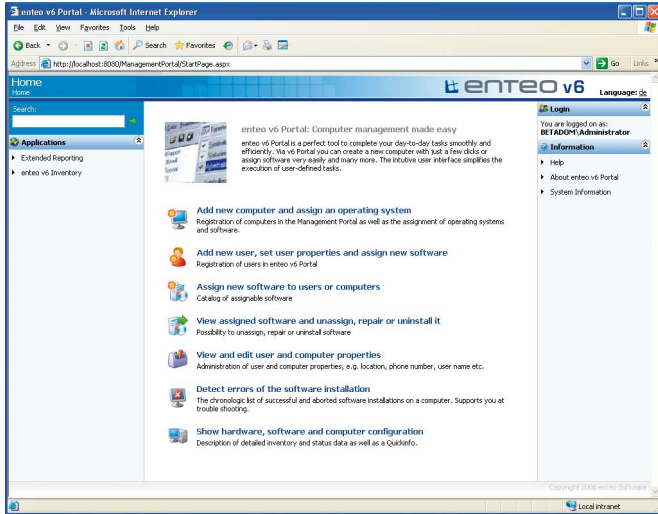

- Decentralization of software and computer management
- Reduced time and personnel expenses for software management
- Significant relief of the IT department
- Reliability due to a high level of automation
- Heightened sense of own responsibility within individual departments
- Fast response to changing requirements
- High level of process transparency
- Increased user satisfaction
- Makes flexible outsourcing possible

functions is accessible via the websites, which are called up using Microsoft Internet Explorer. Technical expertise is not required for performing the tasks, as easy-to-use wizards lead the user through the necessary steps and prevent incorrect entries. If, for example, a user is assigned a new software program, enteo v6 Portal recognizes the number of computers to which the user logs on. It is then specified in a dialog box on which computers the software will in fact be installed. In the context of rule-based management, enteo v6 automatically generates a corresponding policy and carries out its implementation.

Detailed Authorization Control

enteo v6 Portal is fully integrated into the role and authorization model of the enteo v6 family. Administrators use the Active Directory to define which users in the department have access to the management portal, which software can be distributed and which systems or users these authorizations apply to. This sophisticated concept reliably prevents errors while allowing departments a maximum level of freedom for processing their requests.

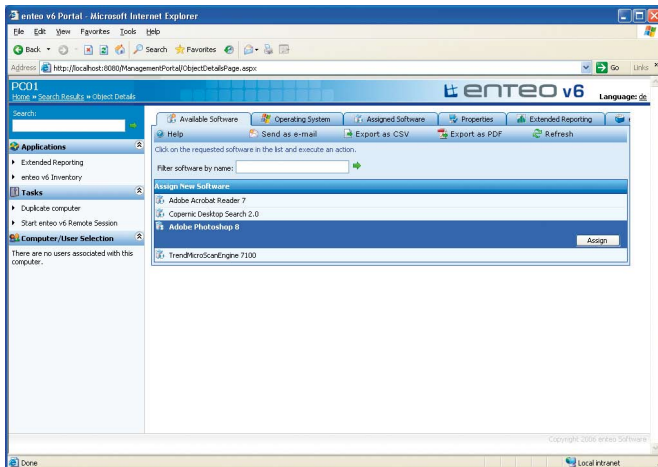

enteo v6 PORTAL

Typical Lifecycle Management tasks clearly summarized

Key Features

- All packaged applications can be provisioned
- Web interface available from anywhere within the company
- Access via a normal browser
- Program operation optimized for use by non-technical personnel
- Incorrect entries are recognized
- Wizards simplify tasks and prevent incorrect entries
- Security by means of clearly structured role and authorization model

Quick and intuitive operation, even for non-technicians

System Requirements:

Server

Windows 2000 Server SP4 and higher
 Windows 2003 Server x64
 MS SQL Server 2000 SP3 and higher
 MSDE 2000 SP3 and higher
 IIS 5.0 and higher
 IE 5.5 and higher

Client

Windows 2000 and higher
 Windows XP x64
